

Jurassic Sea Creatures

The worlds most dangerous sea creature that lived millions of years ago the Megalodon!

You will be learning about the most scariest creatures of deep black waters that lived over millions of years ago. How these animals survived underneath the black scariest waters? Now lets dive in and see!

Megalodon

The Megalodon was not a shark that would live today it was scary and huge and most of all vicious. From the directors of the movie "Jaws" they estimated the jaws to be 25 feet long from the real fossil! Speak of how big this Giant is it's over 50

feet long! You thought that was a lot well it weights 70 TONS! You will not believe how big its teeth are: they're 7 to 8 inches long!

Ancient sea turtle.

Nautilus

Bizarre shrimp-like creatures (nautilus) were the world's largest predators for millions and millions of years in the deep black seas. These creatures lived longer than scientists know! The nautilus was a creature known as Anomalocaridid, big sea creatures almost 6 feet in length and they are also have soft-jointed bodies and toothy jaws.

Mollusks

Lets dive to the bottom of the ocean because that's where you'll find the mollusks. Mollusk belongs to an ancient group of large marine animals, it is known as the Phylum Mollusca. Well known sea mollusks are in this group that you might know octopus, giant squid, colossal squid, scallops, clams, mussels, slugs and

last but not least snails.

Mollusks are also on of the earliest sea creatures in the prehistoric Era (Mesozoic Era).

Sea Turtles

Let dive out of the deep sea and go on the beach. Seven species of sea turtles existed over 450 million years ago. Six of the seven sea turtles where ancient marine animals. Sea turtles where one of the first animals on earth over 540 million years ago during the Paleozoic Era. These ancient sea turtles where over 15 to 16 feet long
