

GLOBAL WARMING

By Alexander Harrison

Global Warming is affecting the World in a negative way.

THE WORLD IS HEATING UP!

Global warming is when the Earth heats up. This happens when CO₂ (Carbon Dioxide) and other toxic gases, such as Greenhouse Gases, goes into the air and increases the temperature. The sun and heat gets trapped in the Earth's atmosphere. The Ozone Layer gets thinner and thinner until the Earth heats up. This change in climate is affecting people, animals and the environment all around the world in a negative way.

IT'S A PROBLEM!

Global warming is happening because people are using gases, oils, fossil fuels, and factories creating CO₂. All these fuels are toxic and are damaging our environment.

The arctic Ice Caps are melting at a rapid rate. If this continues there will be no more ice for the polar bears, penguins and polar foxes.

There has also been an increase in weather patterns because of the change in the Earth's

temperature, which has caused a rise in the sea levels, creating tsunamis, earth quakes, and hurricanes around the world.

Because of Global Warming, some animals may become extinct, since they will have no place to live and will eventually die.

How to Prevent Global Warming

We should all try our best to help with global warming.

These are some of the ways we can all help with global warming.

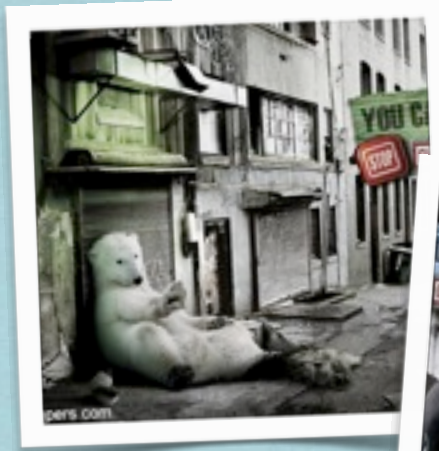

- Recycle
- Use florescent light bulbs
- Car-Pool
- Use reusable bags
- Unplug electrical devices, even when they are turned off
- Shutting the computer off when not in use

If we don't work together to help global warming, it will only get worse.

So let's all do our part, and work together to save our Earth!

QUIZ

* What do you think will happen to the Earth if we don't stop Global Warming?

answer _____

Lined writing area for the student's answer.
