

Trees

By Christian Demushkin

People are cutting down trees and it is having a negative effect on the world. Some of the things that could happen are some animals can't hibernate in the winter like squirrels. Also you hurt the environment, trees have feelings too, it's true. And there will be no more forest. There will just be a big field. If people still keep doing it, then we could have no more trees & the Earth would have very little oxygen to breathe. The destroying of trees could be reversed if people could go out and plant trees. If every time someone cut down a tree, they planted a new tree, then we would not run out of trees.

Scientists have discovered that there are about 10,000 species of trees in the world and 1,000 in United States. Because we need the wood from trees to build houses, furniture and tools as well as make paper, over the centuries, the amount of trees in the world have decreased. It seems that the solution is to find a more renewable recourse. Trees are renewable if we plant more of them.

Fun Fact
You know trees can live to 100-1,000 years!

This is a Kapok Tree.

This is a Sabre tree.
